

Chief Technology Officer -- Position Description

MANDATE CONTEXT

This is a succession mandate: the current CTO is being promoted internally to a group-wide role and a replacement is needed to lead the technology organisation for the core product line. Internal context: the engineering team has grown quickly over the last two years and would benefit from stronger platform and reliability discipline; this should be treated as a priority for the first six months.

IDEAL PROFILE

We need a technically credible, product-minded Chief Technology Officer who has scaled an engineering organisation through a period of rapid growth, and who is equally comfortable in the codebase and in the boardroom.

REPORTING STRUCTURE

The role reports to the Chief Executive Officer. The CTO will have six direct reports and lead an engineering, product, and data organisation of around one hundred and twenty people. The role is based in Amman, Jordan, with regular travel to Dubai.

EMPLOYMENT AND PACKAGE

This is a full-time, permanent position, with a target start date of 1 November 2026. The base salary range is USD 28,000 to USD 35,000 per month. The notice period required is two months. Bonus target is 30 percent of base salary. LTIP: a standard employee stock option grant, vesting over four years.

Benefits and allowances include a remote-work stipend, an annual learning and conference budget, and premium health cover for the candidate and their family.

CANDIDATE REQUIREMENTS

Required: experience scaling an engineering organisation from roughly fifty to over one hundred engineers.

Required: hands-on experience with platform reliability, on-call practices, and incident management at scale.

Preferred: experience introducing applied machine learning or AI features into an existing product.

Preferred: prior experience presenting technology strategy directly to a board.

COMPETENCY WEIGHTING

Technically, platform architecture and reliability should carry the most weight, closely followed by engineering management at scale, with data and AI strategy and security and compliance each carrying a somewhat smaller share.

Behaviourally, cross-functional influence with product and commercial stakeholders should be weighted most heavily, with team building and mentorship close behind, and resilience under ambiguity weighted a little lower.
